

OpenDocument Reader

Get the app

 Private by design — nothing leaves your device

Open **any** office document, **anywhere.**

Android's first OpenOffice and LibreOffice reader, shipping since 2010.
Opens ODT, ODS, ODP, DOCX, XLSX, PPTX and PDF on your phone, in
complete privacy: offline, without an account, and without uploading
anything.

Free, ad-supported, and **open source**. An ad-free paid edition is on both stores.

See for yourself

This page runs the same C++ engine as the apps, compiled to WebAssembly. Drop a document below and it is decoded and laid out **inside your browser** — nothing is uploaded, and the page works with your network switched off.

Open a document

ODT, ODS, ODP, DOCX, XLSX, PPTX, PDF and more — it stays on your device

Choose a file

Try a sample document

Powered by [@opendocument/odr-core](#) — the renderer is fetched only when you open something.

A reader, not a compromise

Complex formatting, embedded images, tables and charts survive the trip to a small

screen — and the parts you actually need on the move are one tap away.

Search and highlight

Find a keyword anywhere in the document and see every hit marked in place.

Fix a typo on the go

Basic editing for the last correction before you send it — no round trip to a desktop.

Password-protected files

Encrypted documents open the same way, with the password never leaving the device.

Works offline

Everything is decoded on your device, so a tunnel or a plane changes nothing.

Distraction-free reading

Full-screen mode for reading notes on the bus, with the interface out of the way.

Read out loud

Text-to-speech reads a document back to you, hands free.

Select and copy text

Pull a paragraph out of a document and paste it wherever you need it.

Print

Send a document straight to any printer your device can reach.

Opens from wherever your documents already are

Tap an attachment in Gmail, Drive, iCloud, OneDrive, Nextcloud, Dropbox or Box and it opens here. Or browse your device with the built-in file explorer.

Built for ODF. Fluent in the rest.

The Open Document Format is what LibreOffice and OpenOffice write, and it is what this reader was built around. Everything else it learned because you get sent those too.

ODT

EPS

DXF

PSD

ODF is also the format behind NeoOffice, StarOffice, Collabora, OnlyOffice, IBM Lotus Symphony, WPS Office, AndrOpen Office and a long tail of others — if a suite exports ODT, ODS or ODP, this opens it.

PRIVACY

Privacy you don't have to take on trust

A document reader sees everything you open with it — contracts, notes, payslips. This one has nowhere to send any of it: there is no server behind the app, and the code that opens your files is public.

 [Read the source](#) →

Nothing is uploaded

Documents are decoded on your device. There is no server to send them to, no account to make, and nothing to delete afterwards.

Open source, all of it

The apps, the rendering engine and its bindings are public. Read the code that opens your files, or build it yourself.

Made in Austria

A small independent project, not a division of anything. Ads in the free edition pay for the work; the paid edition has none.

Use the engine yourself

The part that reads the documents is a C++ library called [OpenDocument.core](#). It is published for the web and for Python, under the MPL-2.0.

NPM

**@opendocument/odr-core**

The engine as WebAssembly. Render documents to HTML in a browser or in Node, with no server – it is what the demo above runs on.

```
npm i @opendocument/odr-core
```

PYPI

**pyodr**

Python bindings to the same C++ library, for batch conversion, indexing pipelines and anything that needs documents as text.

```
pip install pyodr
```

GITHUB

**opendocument-app**

The C++ engine, the Android and iOS apps, the rendering test corpus and the packaging recipes. Issues and pull requests welcome.

```
git clone OpenDocument.core
```

< > Both apps compile no native code of their own — Android pulls an `odr-core-android` AAR from Maven Central and iOS a `odrCoreObjC` Swift package, so every platform reads documents through exactly the same code.

Get OpenDocument Reader

Free on Android and iOS, and on F-Droid for a build with no proprietary dependencies at all.

Prefer it without ads? **Pro** is the same app, paid once: [Google Play·App Store](#)

OpenDocument Reader

View OpenOffice and LibreOffice documents on the go. Open source, made in Austria.
